Why Sequence the Genome?

What are the benefits of genome sequencing?

Refresher

Central dogma

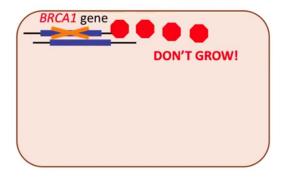

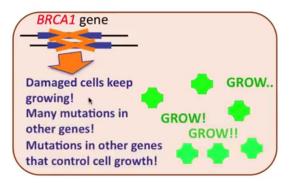

Sequencing

- What does "sequencing" mean?
- Why sequence?
- Why sequence DNA and RNA?

Why sequence DNA?

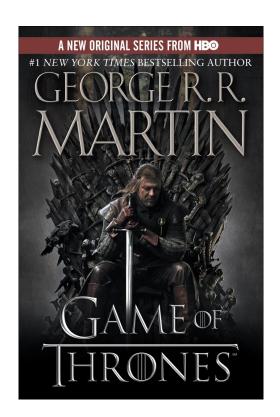

BRCA1 and BRCA2 genes (BReast CAncer susceptibility genes) code for proteins that block cell growth when cell is damaged

Do we need computers?

- Human genome is 3 billion bps long
- How many GoT books is that?
 - 3.000 letters per page
 - 1.000 pages per book
- It would take 1.000 GoT books (stack 50m high) to write down a single human genome sequence
- Impossible to analyze manually

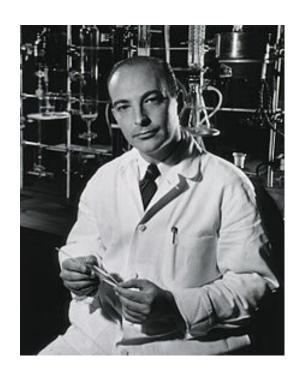

The Birth of Sequencing Technologies

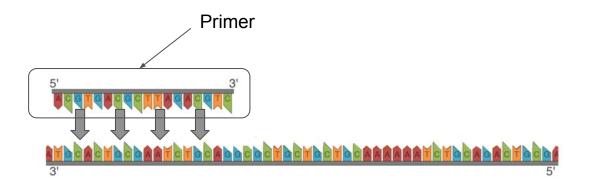

The discovery of DNA polymerase, modified nucleotides and the Chain termination method

Crucial Concept: DNA Replication

- 1956 Arthur Kornberg et. al. (New York University)
 - discovered the DNA Polymerase
 - And that polymerase facilitates DNA synthesis
 - zipper molecule

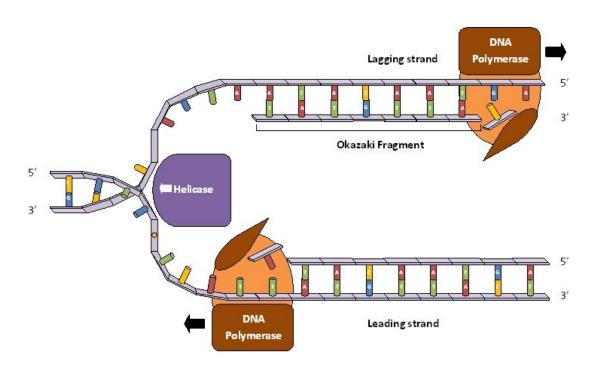

PCR Primers

DNA Replication

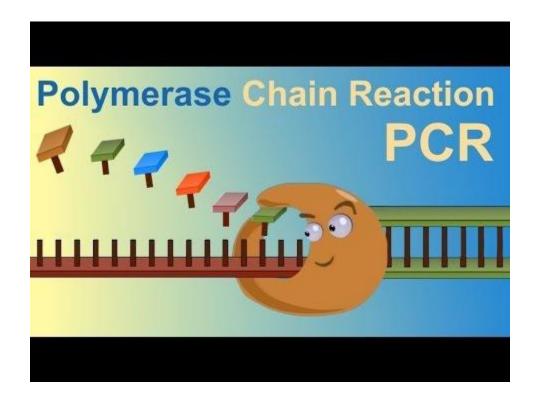

PCR: Polymerase Chain Reaction

- DNA Polymerase Chain Reaction (PCR) chemistry based on thermo cycling; acute and repeated i.e. cyclic temperature fluctuations for denaturation and hybridization of complementary strands of DNA
- Taq Polymerase Thermus Acquaticus
 - Not human polymerase
 - Taq is more temperature resistant to high denaturation temperatures of thermocycler

Terminating and Labeling Nucleotides

Sanger

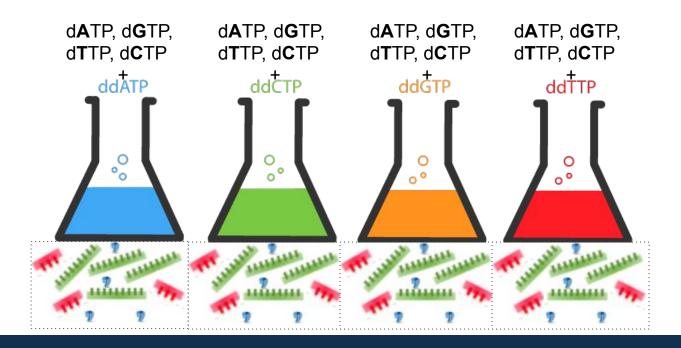

- Chain **Termination** Method
- dNTPs + labeled ddNTPs
- Southern Blotting on Electrophoresis gel

NGS

- Reversible termination
- No termination
- Slides

Illumina sequencing: Paired ends

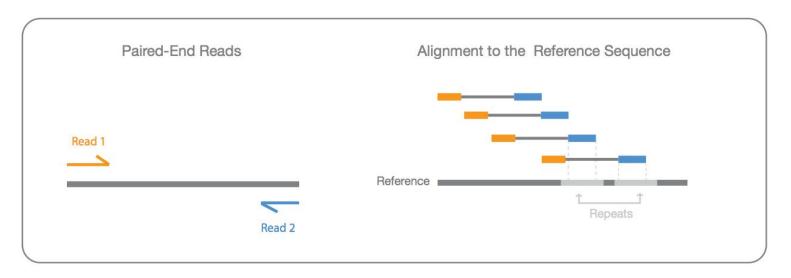

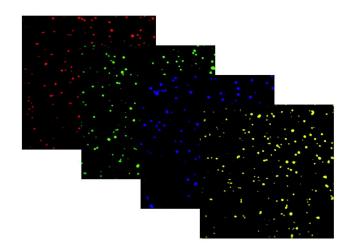

Figure 4: Paired-End Sequencing and Alignment—Paired-end sequencing enables both ends of the DNA fragment to be sequenced. Because the distance between each paired read is known, alignment algorithms can use this information to map the reads over repetitive regions more precisely. This results in much better alignment of the reads, especially across difficult-to-sequence, repetitive regions of the genome.

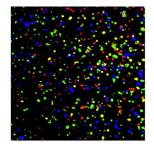

Recording called bases or reads

The FASTQ file format

Image processing

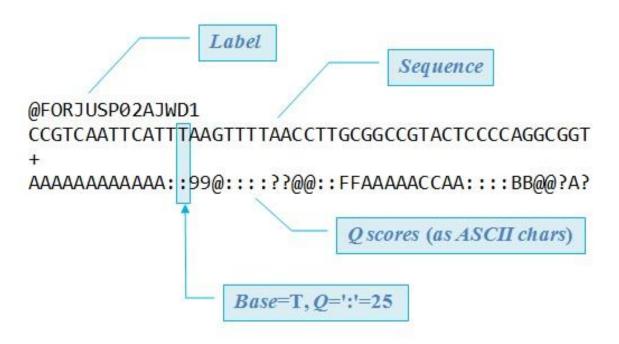

- Sequencing produces high-resolution TIFF images
- 100 tiles per lane, 8 lanes per flow cell, 100 cycles
- 4 images (A,G,C,T) per tile per cycle = 320,000 images
- Each TIFF image ~ 7Mb = 2,240,000 Mb of data (2.24TB)

Base calling - uses cluster intensities and noise estimate to output the sequence of bases read from each cluster, along with a confidence level for each base.

FASTQ file format

Phred Scoring

Quality score interpretation

$$Q = -10 \log_{10} P$$
 \longrightarrow $P = 10^{\frac{-Q}{10}}$

Phred Quality Score	Probability of incorrect base call	Base call accuracy			
10	1 in 10	90%			
20	1 in 100	99%			
30	1 in 1000	99.9%			
40	1 in 10000	99.99%			
50	1 in 100000	99.999%
